## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 79-96 are considered allowable over the cited prior art of record.

The following is an examiner's statement of reasons for allowance:

The main cited prior art references cited, Markowitz et al. (US 6,651,103) in view of Pinckney et al. (US 2002/0169926), and other prior art fail to teach or suggest all of the claim limitations.

Markowitz teaches a media storage device where all versions of media information are made available from a media server (col. 4, ll. 20-27). The media storage device responds to requests from user devices utilizing a gateway proxy device that checks the media storage device for a version of the media information. When the requested version is found and thus retrieved from the media storage and streamed to the user device without interacting with the media server (col. 6, ll. 32-40).

Pinckney teaches the transmission of data by a content provider that may be a superset of data to be streamed to a client (p. 3, para. 0033). Pinckney teaches further the utilization of protocol-independent caching whereby the protocol used by a client to access content from a cache is separated from the protocol used to fetch the content from the content provider in the cache. Content is translated from a protocol-specific form into a protocol-independent form when content is provided. Content is translated from a protocol-independent form back into a protocol dependent form when a user makes a request to the cache from streaming (p. 7, para. 0069).

Therefore, the combination of the cited prior art and other prior art fail to teach or suggest a network caching system that includes both a protocol dependent subsystem and

Art Unit: 2142

a protocol independent subsystem, specifically, as recited in exemplary claim 79, a network caching system in combination with “a protocol dependent caching subsystem, which includes a plurality of streaming media encoders to support a plurality of streaming media protocols, wherein the protocol dependent caching subsystem is configured to interact with an upstream server, including to obtain from the upstream server streaming media data encoded according to a particular streaming media protocol, to decode the streaming media data for storage in the mass storage facility, and subsequently to encode the streaming media data into a first streaming media protocol used by a client system after the streaming media data is retrieved from the mass storage facility for delivery to the client system; and a protocol independent caching subsystem, distinct from the protocol dependent caching subsystem, configured to manage flow of streaming media data to and from the operating system in a streaming media protocol independent manner, including to store the streaming media data obtained from the upstream server in the mass storage facility after the streaming media data has been decoded by the protocol dependent caching subsystem, in a form that is encapsulated in a network protocol to be optimized for delivery to the client system, and to store streaming protocol specific metadata with the streaming media data in the mass storage facility, and subsequently to retrieve the streaming media data from the mass storage facility for subsequent encoding by the protocol dependent caching subsystem and delivery to the client system, wherein the protocol independent caching subsystem further is configured to deliver the streaming media data to the client system according to the first streaming media protocol and to control a pace of delivery of the streaming media data to the client.”
